How many attributes / columns are there?

In general:

Natural Join

$$T_1 \bowtie T_2 = \Pi_S \left(\sigma_{T_1.A_1 = T_2.A_2 \wedge \dots \wedge T_1.A_d = T_2.A_d} (T_1 \times T_2) \right)$$

where

$$S = (S_1 - S_2) \cup \{T_1.A_1, \dots, T_1.A_d\} \cup (S_2 - S_1)$$

where S_1 and S_2 are the schemas of T_1 and T_2 respectively, and A_1, \dots, A_d are the common attributes of T_1 and T_2 .

Natural Join breaks the whole system!

Past Muddiest Points

- One day, the guy change the schema (by mistake)

	cityCode	cityName
	01792	Swansea
	10	Beijing
	416	Toronto
	212	NewYork

City

areaCode	areaName
40	United Kingdom
852	Hong Kong
1	North America
86	China

Area

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

```
select *  
from City, Area  
where City.areaCode = Area.areaCode
```

SQL Warning:
No areaCode

```
select *  
from City inner join Area
```

```
on City.areaCode = Area.areaCode
```

```
select *  
from City natural join Area
```

Cartesian Product!

It breaks the system!
But no warning.

Past Muddiest Points

- Lesson learnt
 - Database related codes may not update for years. aka, compile-time warning in Java / C / C++. Spot mistakes early.
 - If something wrong, you need some warnings reminders.

- Old School Wisdom

- Use join with **explicit join condition in SQL**
- Never use **Natural Join Keyword in SQL**

In theory, theory and practice are the same. In practice, they are not.

— Albert Einstein —

Assignment Project Exam Help

- Natural join in Relational Algebra is fine.
 - Part of the theory, designed for easy manipulation.
 - You should use the **concept** in Relational Algebra and SQL too.
- But practically, treat **Natural Join Keyword in SQL** as if it never exists, avoids it like a plague.
- In CW2 & Exam, if you use **natural join keyword in SQL**, **no marks**.
 - Learn the **correct** way of translating concept of natural join from RA to SQL.

Add WeChat powcoder

$$\Pi_{S_1-S_2}(T_1) - \Pi_{S_1-S_2}(\Pi_{S_1-S_2}(T_1) \times T_2 - T_1) = T_1 \div T_2$$

Division

$$\Pi_{S_1-S_2}(T_1) - \Pi_{S_1-S_2}(\Pi_{S_1-S_2}(T_1) \times T_2 - T_1) = T_1 \div T_2$$

Which operations go first?

Assignment Project Exam Help

- Complex expressions can be composed recursively, just as in arithmetic. <https://powcoder.com>
- Parentheses and precedence rules define the order of evaluation. Add WeChat powcoder
- Precedence, from highest to lowest, is:
 - σ, Π, ρ
 - \times, \bowtie
 - \cap, \div
 - $\cup, -$
- Unless very sure, use brackets!

SQL and Division

```
(select pid from T1)
```

```
minus
```

```
select pid from (
```

```
(select * from (select pid from T1), T2)
```

```
minus
```

```
(select * from T1))
```
